

## Stakeholder Map — Payment Exception & Reconciliation Workflow Redesign

| Stakeholder                      | Role                                                        | Primary Goal                                                                                                  | Primary Fear                                                                                    | Influence                 | Interest                         |
|----------------------------------|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|---------------------------|----------------------------------|
| Marcus Oyelaran                  | Operations Lead                                             | Clear the daily exception queue fast; keep the team's manual workload sustainable                             | Backlog growing faster than the team can manually clear it, burning out the reconciliation team | Medium                    | High                             |
| Sandra Lindqvist                 | Finance Controller                                          | Close the books on schedule every month-end; minimize unresolved-exception value sitting on the balance sheet | Late book closure due to unresolved breaks; auditors flagging unexplained variances             | High                      | High                             |
| Devraj Kapoor                    | Compliance/Audit Lead                                       | Every exception is properly investigated and logged before resolution, regardless of how small                | A genuine fraud or error gets "auto-resolved" as a rounding difference and never investigated   | High                      | High                             |
| Engineering/Data Lead (implicit) | Builds and maintains the matching engine                    | A precise, buildable spec — exact matching logic, exact thresholds                                            | Vague rules that can't be implemented deterministically                                         | Medium                    | Medium                           |
| External Auditor (implicit)      | External body reviewing reconciliation controls at year-end | Institution can demonstrate a defensible, consistent control process                                          | Inconsistent or undocumented manual overrides discovered during audit sampling                  | High (external, periodic) | Low (engages only at audit time) |

## Persona briefs:

**Marcus Oyelaran — Operations Lead.** Manages the team that manually pulls CSVs from three systems and reconciles them by hand. Measured on queue clear-time and backlog size. Wants automation to reduce manual toil, but doesn't want automation that creates more exceptions than it resolves.

**Sandra Lindqvist — Finance Controller.** Owns the month-end close calendar. Every unresolved exception is a line item she can't fully explain to her own leadership. Wants speed — but only speed that doesn't create downstream audit findings.

**Devraj Kapoor — Compliance/Audit Lead.** Doesn't care how long reconciliation takes; cares that nothing gets resolved without a logged reason. Will block any automation rule that resolves an exception without leaving an auditable trail of *why* it was resolved that way.

**The conflict, named directly:** Sandra wants exceptions cleared fast so the books close on time. Devraj wants every exception properly investigated, even if that's slower, because an exception "auto-resolved" too eagerly might be hiding a real error or fraud, not a rounding difference. Under a fully manual process, the team is too slow for Sandra; under a "resolve everything automatically" process, Devraj has no real audit trail. **The BA's job is to make this conflict disappear — not by picking a side, but by tiering the exceptions themselves: auto-resolve the trivial, provably-safe matches instantly, while routing genuine breaks to the aging-based escalation Devraj needs, with every resolution path equally logged.** Speed and scrutiny stop competing once they're applied to different *categories* of break, not the same undifferentiated queue.
